Modern scientific research and megascience experiments

The CERN accelerator complex Nuclotron-based Ion Collider fAcility (NICA, JINR, Dubna, Russia) (Switzerland) ... need large-scale computing systems to store large amounts of data and process them in a relatively short time! mese and Source Collider many others... project (BEPC, (HEPS, China) China

- Geographically distributed infrastructure.
- Large-scale systems.
- Designed to work with extremely large amounts of data.
- Consists of various types of resources.
- Collective shared access to data storage and processing resources.

Important!

The systems must guarantee highquality and efficient operation.

How to ensure design, continuous improvement and scaling of DDC?

The systems must guarantee highquality and efficient operation.

Priakhina D., Korenkov V. The relevance of creating a digital twin for managing distributed centers for collecting, storing and processing data // Modern Information Technologies and IT-Education, Vol. 19, No 2, pp. 262-271, 2023. – ISSN:2411-1473.

Worldwide LHC Computing Grid

JINR MULTIFUNCTIONAL INFORMATION AND COMPUTING

Important!

Modeling of complex computing systems.

Describes the system.

Reflects the processes taking place in the system.

Testing of the system with different variants of equipment parameters, data flows and jobs.

The systems must guarantee highquality and efficient operation.

Priakhina D., Korenkov V. The relevance of creating a digital twin for managing distributed centers for collecting, storing and processing data // Modern Information Technologies and IT-Education, Vol. 19, No 2, pp. 262-271, 2023. – ISSN:2411-1473.

Digital twin (DT)

Real-time operation throughout the entire DDC life cycle.

COMPUTER MODEL

INPUT DATA

- Architecture and hardware parameters of DDC.
- Characteristics of data flows and job flows.

FUNCTIONAL PURPOSE

- Designing of DDC.
- Analysis of the efficiency and reliability of DDC.
- Testing scaling scenarios based on data flows and job flows requirements.
- Assessment of the required amount of resources for specific tasks.
- Checking job flows management strategies.

Priakhina D., Korenkov V., Trofimov V. Method for constructing digital twins to solve problems of effective management and development of distributed centers for collecting, storing and processing data // Modern Information Technologies and IT-Education, Vol. 19, No 2, pp. 272-281, 2023. – ISSN:2411-1473.

Digital twin (DT)

The modeling core provides the functioning of a DT.

Probabilistic distributions are taken into account when forming data flows, job flows, and criteria for the functioning of equipment.

Generating parameters for data & jobs flows:

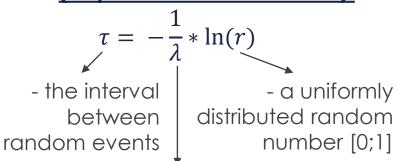

$$pr(x) = \frac{1}{h-a}$$

- the probability density function of a uniform distribution, where changing the parameter value

$$pn(x) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

- the probability density function of the normal distribution, where [a, b) — the interval for μ — the average value of a random variable, σ — standard deviation

Event flow generation (exponential distribution):

- the average number of events per unit of time

Software complex for creating digital twins of DDC

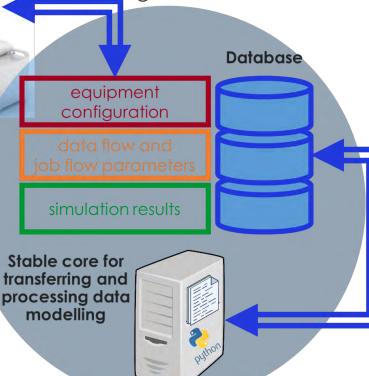

Web-service

Functionality of the web service

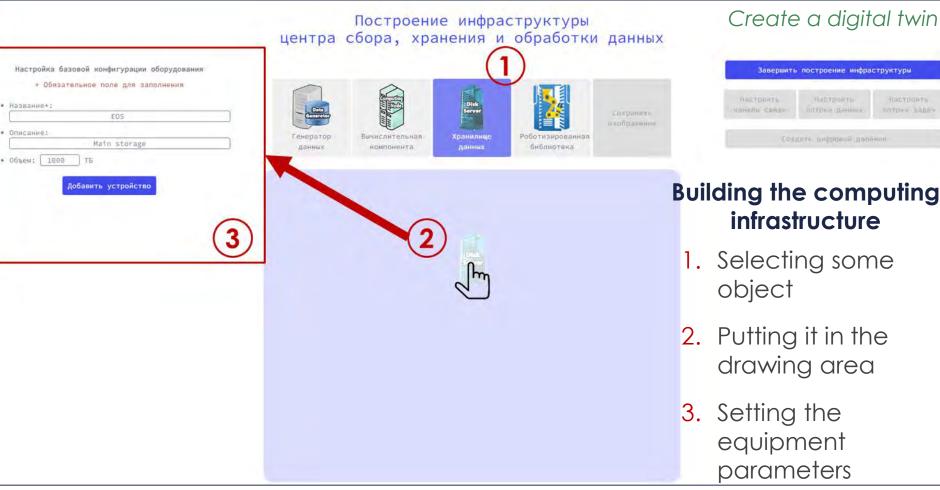

- Setting the parameters of the DDC equipment & characteristics of data flows and jobs flows.
- Configuration of DDC scaling scenarios.

- Building the DDC structure.
- Starting the DT.
- Viewing the results of the DT.

The prototype of the web service has not yet been localized.

Adding and configuring events in the system

The digital twin results

Результаты эксперимента Test 1

Available for viewing:

- data storage load volume;
- using cores on computing components;

- load on communication links;
- job queues, the number of completed jobs;
- distribution of files in storages.

DT of distributed systems for megascience experiments

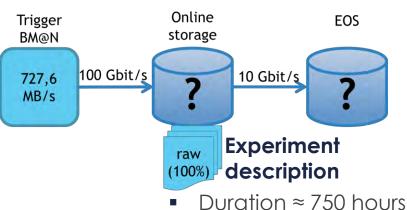

Russia, Moscow region, Dubna, Joint Institute for Nuclear Research

Verified by the example of the BM@N experiment computing infrastructure

Experimental data acquisition and storage

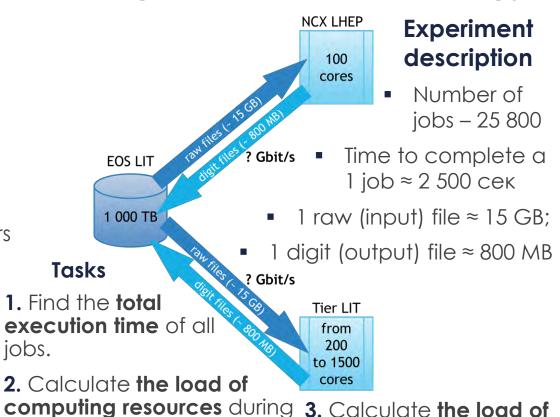

- Bordhorr 730 nec
- 1 raw file ≈ 15 GB

Tasks

- 1. Find the amount of resources that are needed to store all raw-data on the Online storage.
- **2.** Find the **number of raw files** in the EOS storage.

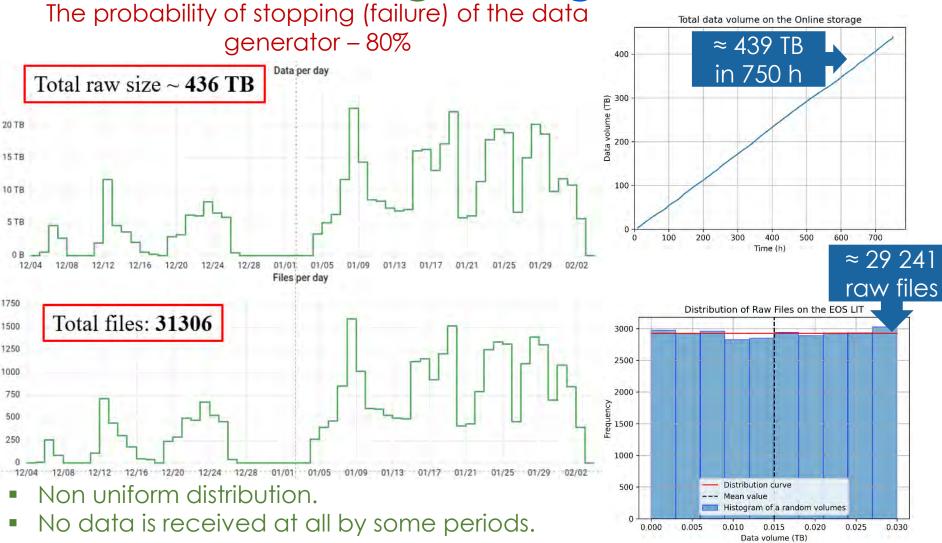

Running experimental data processing jobs

the execution of jobs.

communication links.

Monitoring VS Digital Twin

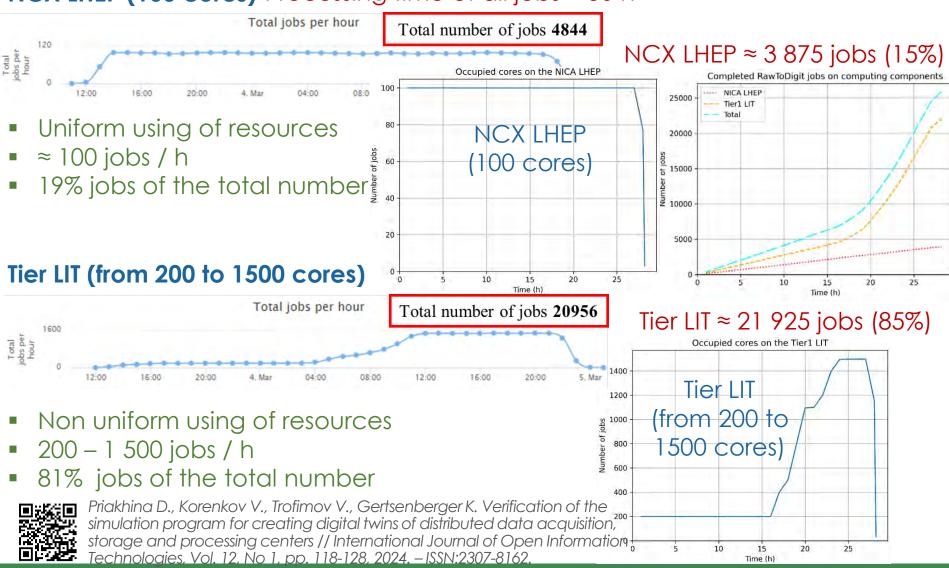

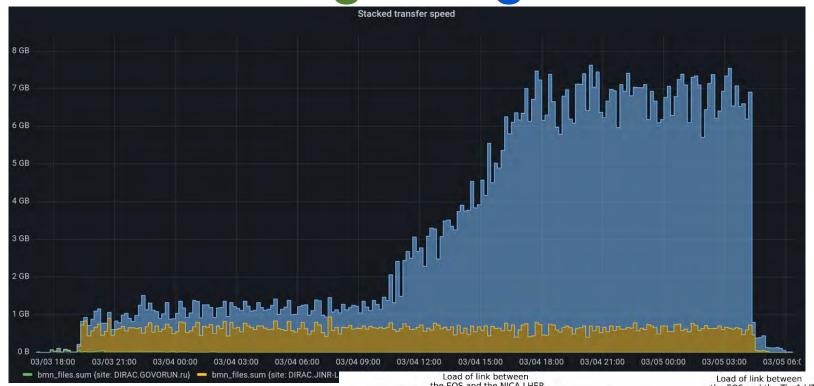

Priakhina D., Korenkov V., Trofimov V., Gertsenberger K. Verification of the simulation program for creating digital twins of distributed data acquisition, storage and processing centers // International Journal of Open Information Technologies, Vol. 12, No 1, pp. 118-128, 2024. – ISSN:2307-8162.

Monitoring VS Digital Twin

NCX LHEP (100 cores) Processing time of all jobs ≈ 30 h

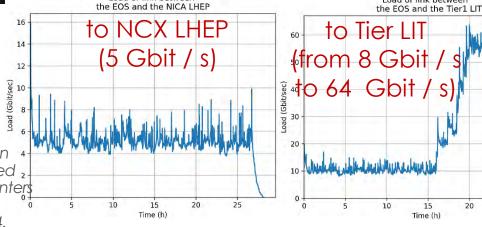

Monitoring VS Digital Twin

- Avg. data transfer rate to NCX LHEP ≈ 4 Gbit / s
- Avg. data transfer rate to Tier
 LIT from 8 Gbit / s to 64 Gbit / s

Digital Twin of the BM@N experiment computing infrastructure

Построение инфраструктуры центра сбора, хранения и обработки данных

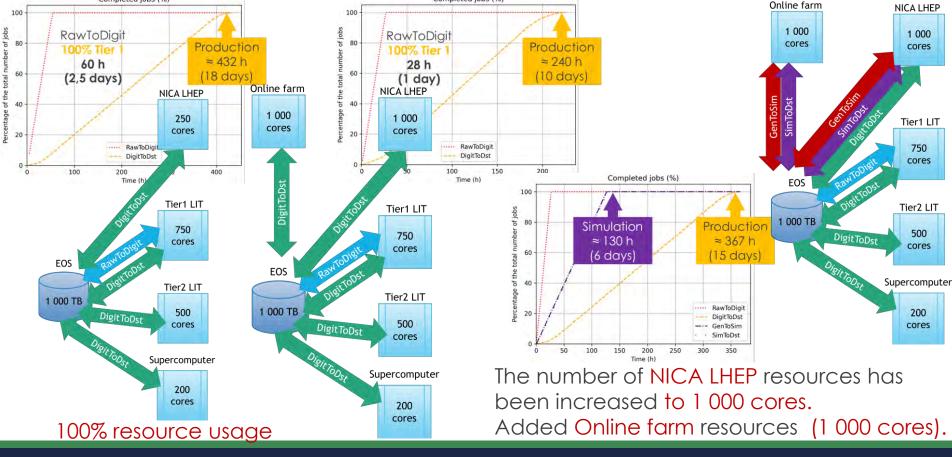

Goals:

- assessing the resource requirements for data storage and processing, taking into account the planned parameters of the data flows of future experimental Runs;
- obtaining an approximate time that will be required to process the data at the end of the experiment Run.

Digital Twin of the BM@N experiment computing infrastructure

Conclusions

- Software complex has been developed to create digital twins of distributed data acquisition, storage and processing centers:
 - o database;
 - modelling program (successful approbation);
 - web-service (prototype: building DT, setting configurations, starting DT, viewing results).
- > The modeling program takes into account:
 - the probability of failures and changes in equipment parameters;
 - requirements for stored data flows;
 - o requirements for data processing job flows.

The certificate of state registration №2023667305 (14.08.2023, Russia)

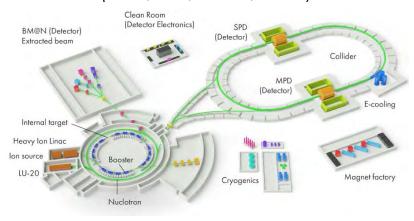

Conclusions

Software complex is used for the design of NICA project computing infrastructures.

Nuclotron-based Ion Collider fAcility (NICA, JINR, Dubna, Russia)

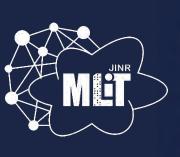

The examples confirm the possibility of further use of the software complex and digital twins for solving management and development tasks of distributed computer systems for megascience projects.

Acknowledgments

- 1. This work is supported by **JINR grant for young scientists** No. 24-601-02.
- 2. Thanks to **Konstantin Gertsenberger (LHEP)** for providing the source data and the opportunity to use the software complex for modeling of the BM@N experiment computing infrastructure.
- 3. Thanks to **Igor Pelevanyuk (MLIT)** for providing data monitoring the use of the BM@N experiment computing infrastructure for verification of the modeling program.
- 4. Thanks **Danila Oleynik (MLIT)** and SPD collaboration for providing the source data and the opportunity to use the software complex to create digital a twin of SPD Online filter.

28th International Scientific Conference of Young Scientists and Specialists

Thank you for the attention!
